We cannot expect the growth, even ultimately, of a significant quantitative theory using substantial mathematical tools which will embrace an appreciable part of the physics and at the same time incorporate a non trivial geometry. One type of model allows the use of significant linear techniques (essentially Fourier analysis enhanced by asymptotics) to describe a relatively large amount of physics by remaining within the realm of trivial geometries such as an infinite homogeneous plasma, possibly with a superposed small linear macroscopic gradient. We shall be concerned with a model of a second type containing somewhat less physics but aimed at the exploitation of more elaborate mathematical tools in more practical geometrical configurations.
